

Exercise 1

In a farm, there are 3 species of animals: chickens, cows and pigs. The farmer will give you a subtotal for each species, for example (2, 3, 5) means 2 chicken, 3 cows and 5 pigs. Write a program to compute and print the total number of legs of all animals.

Exercise 2

Write a program that counts points for a basketball game, given the number of 3-pointers scored. and 2-pointers scored for the team and and print that value. For example, points of (1,1) is 5, points of (7,5) is 29.

Exercise 3

The pricing policy of a travel agency for a group tour is given as follow:

- Group of 10 or more pax: 500\$/pax.
- Group of less than 10 pax: 600\$/pax.

Write a program to compute the total cost for a team to buy the tour. The program works as below:

- Input a positive integer corresponding to the number of guests in the team.
- Compute the total cost based on the above pricing policy.
- Print the result to screen console.

Input:

A positive integer corresponding to the number of passengers in the team.

Output:

A number showing the total cost.

Example:

Input	Output
20	10000

Exercise 4

Write a program to compute the area of a triangle. The program works as follows:

- Input two numbers corresponding to the height and the base of a triangle.
- Compute the area of that triangle.
- Print the result to the screen console.

Input:

Two real numbers on a single line corresponding to height and base, separated by a space character. Each number may have both integral and fractional parts.

Output:

A real number printed on the screen console with minimum numbers of digits, while keeping exactly 2 digits in the fractional part of the result.

Example:

Input	Output
4 5	10.00

Exercise 5

Write a program to enter 5 integers from the keyboard. Print the number of integers that have values between 20 and 100. If there is no integer number s

atisfies the above condition, print 0.

Example:

Input	Output
1 21 25 33 200	3

Input: A line of 5 values separated by spaces

Output: Number of integers satisfy the condition

Exercise 6

Write a program that converts a positive integer entered from the keyboard to its 8-bit binary representation. If the entered number is invalid or cannot be represented as an 8-bit binary number, display the message "Unsuccessful!"

Input: A line contains one integer value

Output: A line of eight consecutive bits or string "Unsuccessful!" if the number is invalid or cannot be represented as an 8-bit binary.

Example

Input	Output
15	00001111
